

Safer Home Renovations and Repairs

Did you know?

Construction dust created during home renovation can be harmful. Take steps to reduce dust.

Action Plan

Use these simple steps to keep dust levels low and protect your family.

- ❑ For older homes that may have **lead paint or asbestos**, hiring an EPA-certified contractor is recommended.
- ❑ **Contain the work:** Keep the work area separate from the living space. Use plastic sheeting to cover floors and furniture; cover doorways to the work area and close vents.
- ❑ **Work “wet” to reduce dust:** Mist the surface before removing old paint.
- ❑ **Clean as you go:** Wet clean with a wet mop or wet cloth daily at the end of the job, including cleaning plastic sheeting.
 - Once cleaned, sheeting should be folded inward, then bagged. It is not considered “hazardous waste” so it can go in normal garbage.
 - Do not dry sweep.
- ❑ **Keep children and pregnant people out of the work area.**

Did You Know?

Be lead safe! Lead paint was used widely in homes built before 1978 (or before 1960 in NYC) and can still be in the underlayers of paint. Unless environmental testing shows otherwise, assume paint in older homes contains lead and use lead-safe work practices. To learn more, visit health.ny.gov and search “Lead-Safe Renovation, Repair, and Painting.”

Asbestos: Asbestos may still be found in a wide range of building materials, regardless of the age (ex: pipe insulation, roofing tiles and shingles, patching compounds). The only way to confirm that the material does not contain asbestos is to have it tested. To learn more, visit health.ny.gov and search “asbestos.”

Resources

For information on keeping the air quality safe during renovations, visit epa.gov and search “indoor air quality.”

To find an US Environmental Protection Agency (EPA) certified contractor, visit:

- epa.gov/lead (click on “Find a lead-safe certified firm”)
- epa.gov/asbestos (click on “Hire an asbestos professional”)
