

Did you know?

Climate change is increasing people's risks from insect bites, and bites from ticks and mosquitoes can lead to serious illnesses. Insect repellent ("bug spray") can be a safe and effective way to protect children from bug bites, but it is important to use it

Insect Repellents

Action Plan

- In areas high-risk for serious insect-borne illness:** Choose insect repellents containing 20 - 30% DEET (lasts 5 hours) or 20% picaridin (lasts 3 - 7 hours), oil of lemon eucalyptus (for children over 3).
- Apply Repellent Safely:**
 - Apply outdoors and away from food. Apply directly onto clothes and exposed skin – do not apply under clothes.
 - For young children, spray into your hands, then rub on their skin.
 - Do not apply to eyes, mouth, open wounds, or children's hands.
 - Apply on top of sunscreen. Avoid combined sunscreen-repellent products because sunscreen has to be applied often. DEET should be applied just once a day.
 - Avoid products containing more than 30% DEET.
 - Store products away from young children.
- After Using Repellent:** Wash skin with soap and water. Launder clothes. Check your children's skin closely for ticks from head-to-toe, including the scalp, armpits, and groin.
- Wear Protective Clothing Outdoors:** Wear long-sleeved shirts and tuck pants into socks to prevent bug bites.
- Protecting newborns:** Do not use repellents on babies younger than 2 months. Use protective clothing or mosquito netting on strollers instead.
